Internet

Getting Data from the Server

- Each time the user clicks on an anchor tag with an href = value to switch to a new page, the browser makes a connection to the web server and issues a "GET" request - to GET the content of the page at the specified URL.
- The server returns the HTML document to the browser, which formats and displays the document to the user.

old HTTP1 way of thinking
Browser asks for Doc, get it, retrieves it, shows it!

TCP Connections / Sockets

↳ computer phone calls

"In computer networking, an Internet **socket** or network **socket** is an endpoint of a bidirectional **inter-process** communication flow across an **Internet** Protocol-based computer network, such as the **Internet**."

http://en.wikipedia.org/wiki/Internet_socket

TCP Port Numbers

- A port is an application-specific or process-specific software communications endpoint
- It allows multiple networked applications to coexist on the same server
- There is a list of well-known TCP port numbers

HyperText Transfer Protocol

Wandering through linked documents on the Internet

Uniform Resource Locator

`http://data.pr4e.org/page1.htm`

protocol

host

document

HTTP - HyperText Transfer Protocol

- The dominant Application Layer Protocol on the Internet
- Invented for the Web - to retrieve HTML, Images, Documents, etc.
- Extended to handle data in addition to documents - RSS, Web Services, etc.
- Basic Concept: Make a connection - Request a document - Retrieve the document - Close the connection
- Internet and sockets were created in the 1970's, HTTP was invented in 1990 and is an application protocol that runs atop sockets

Internet Standards

- The standards for all of the Internet protocols (inner workings) are developed by an organization
- Internet Engineering Task Force (IETF)
- www.ietf.org
- Standards are called "RFCs" - "Request for Comments"

maybe?

INTERNET PROTOCOL
DARPA INTERNET PROGRAM
PROTOCOL SPECIFICATION
September 1981

The internet protocol treats each internet datagram as an independent entity unrelated to any other internet datagram. There are no connections or logical circuits (virtual or otherwise).

The internet protocol uses four key mechanisms in providing its service: Type of Service, Time to Live, Options, and Header Checksum.

Hypertext Transfer Protocol -- HTTP/1.1

Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

The Hypertext Transfer Protocol (HTTP) is an application-level protocol for distributed, collaborative, hypermedia information

HTTP!

Example for Specification

5 Request

A request message from a client to a server includes, within the first line of that message, the method to be applied to the resource, the identifier of the resource, and the protocol version in use.

```
Request      = Request-Line                ; Section 5.1
               *(( general-header          ; Section 4.5
                   | request-header        ; Section 5.3
                   | entity-header ) CRLF) ; Section 7.1
               CRLF
               [ message-body ]            ; Section 4.3
```

5.1 Request-Line

The Request-Line begins with a method token, followed by the Request-URI and the protocol version, and ending with CRLF. The elements are separated by SP characters. No CR or LF is allowed except in the final CRLF sequence.

```
Request-Line  = Method SP Request-URI SP HTTP-Version CRLF
```

Making an HTTP Request

- Connect to the server like data.pr4e.org
- - a "handshake"
- Request a document
 - GET http://data.pr4e.org/page1.htm HTTP/1.0
 - GET http://www.mlive.com/ann-arbor/ HTTP/1.0
 - GET http://www.facebook.com HTTP/1.0

with socket
443 or 80

Browser talks to server
sends docs

Note – Telnet is not installed by default on most systems

```
$ telnet data.pr4e.org 80
```

```
Trying 74.208.28.177...
```

```
Connected to data.pr4e.org character is '^J'.
```

```
GET http://data.pr4e.org/page1.htm HTTP/1.0
```

```
HTTP/1.1 200 OK
```

```
Date: Thu, 04 Jan 2018 14:45:10 GMT
```

```
Server: Apache/2.4.7 (Ubuntu)
```

```
Last-Modified: Mon, 15 May 2017 11:11:47 GMT
```

```
Content-Type: text/html
```

```
<h1>The First Page</h1>
```

```
<p>If you like, you can switch to
```

```
the <a href="http://www.dr-chuck.com/page2.htm">Second  
Page</a>.</p>
```

```
Connection closed by foreign host.
```

200 Document OK
404 Not Found

Web Server

Browser

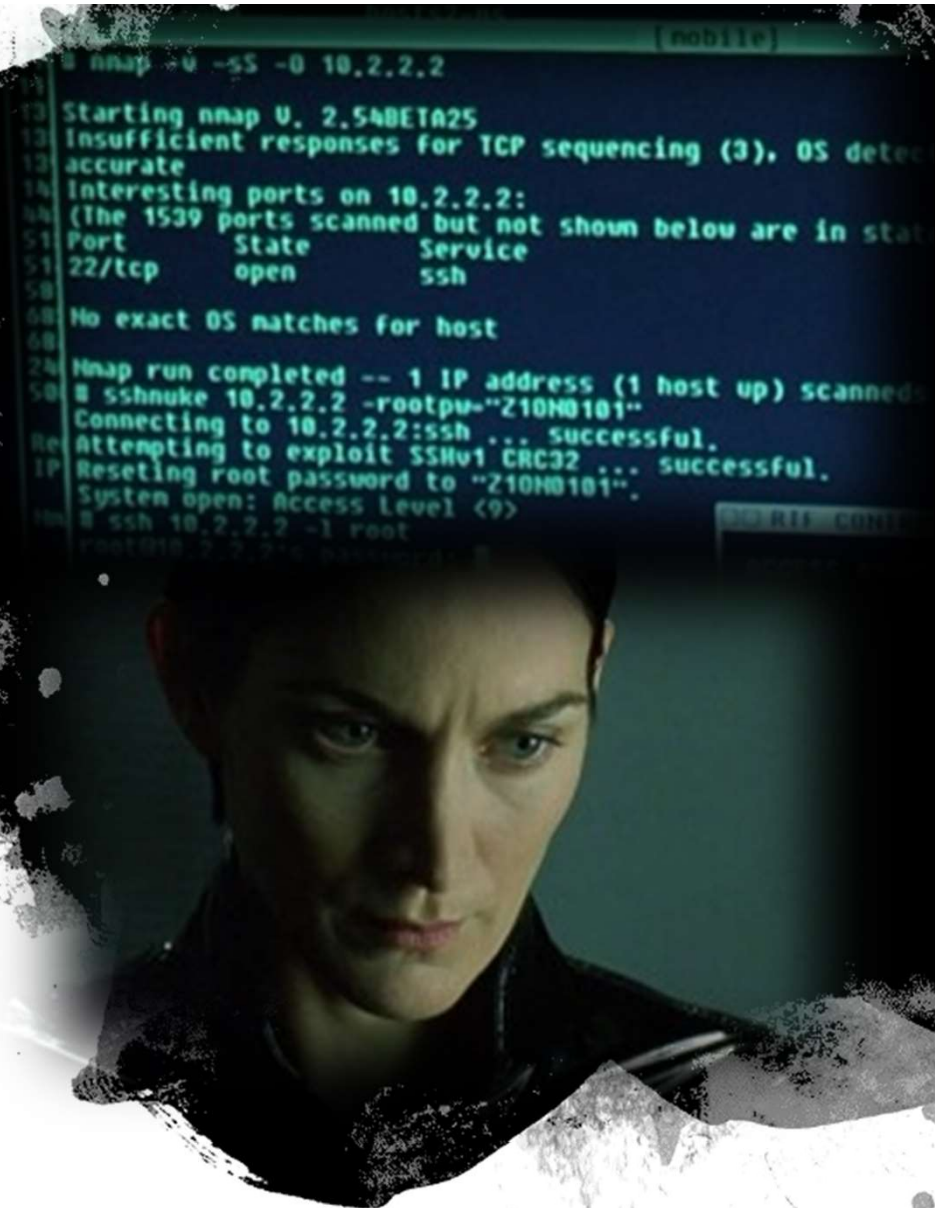

with-lfp
line
(no headers)

maybe try?
install telnet
